Project Abstract Submission Form

Sec No - 1	Team No-19	Project Title-Handwritten Digit Recogniser with a Drawing Canvas
------------	------------	--

Abstract:-

The Handwritten Digit Recogniser with a Drawing Canvas is a machine learning project developed using Python. The project is designed to identify handwritten digits drawn by a user on a digital canvas. A user can draw any number from 0 to 9 using the mouse, and the system predicts which digit has been written. The model is trained using a dataset that contains many handwritten digit images. By learning from different writing styles, the model can recognise common patterns, lines, and shapes used to write each digit. When a user draws a digit on the canvas, the drawing is processed and converted into a format that the model can understand. The trained model then analyses the image and displays the predicted result. This project helps in understanding how machine learning can be used for image recognition tasks. It combines Python programming, image processing, and machine learning in a simple interactive application. The drawing canvas makes it easier for users to test the system by entering digits in their own handwriting. Overall, this project shows how a computer can learn from existing data and use that knowledge to recognise new handwritten digits. It also provides a basic idea of how similar technologies are used in applications such as character recognition, document scanning, and digital form processing.
